## PB2361 PREDIGA, EDUCATIONAL AND DIAGNOSIS PROJECT IN ACID SPHINGOMYELINASE DEFICIENCY DISEASE (ASMD) AND GAUCHER DISEASE (GD): RESULTS TO THE OBJECTIVE ACHIEVED OF 200 PATIENTS ANALYZED.

Jesus Villarrubia[1], Enrique Calderon[2], Marta Morado[3], Victor Quintero[4], Isidro Vitoria[5], Miguel Angel Torralba[6]

**Aims:**

The main objective of this study is to identify patients with idiopathic splenomegaly or splenectomy as well as to promote awareness and knowledge of ASMD and GD and their diagnosis algorithm through a national medical education program . Prevalence of ASMD and GD in patients with idiopathic splenomegaly or splenectomy will be also established.

Promote awareness, knowledge and diagnosis os ASMF and GD

**Methods:**

Regarding educational program, the participating centers lead clinical sessions as part of the PREDIGA education program. It was planned to impart about 100 clinical sessions within the medical education program and reach 200 patients fulfilling diagnostic criteria for ASMD and GD in the recruitment process.

100 educational clinical sessions
200 patients fulfilling criteria

**Results:**

A total of 206 patients' blood samples have been collected to perform a DBS. Results to date have revealed the diagnosis of 2 ASMD and 4 GD patients derived from the epidemiological program. Thanks to implementation of this educational program 2 ASMD and 1 GD patients were diagnosed. Therefore, in this study the prevalence of ASMD and GD in patients with idiopathic splenomegaly or splenectomy is 0.97% and 1.9% respectively.

2 ASMD patients (0.97%)
4 GD patients (1.9%)

Diagnosis

# Who to treat?

To those patients with a **definitive diagnosis of GD**

## Confirming diagnosis

### Enzyme assay

The diagnostic test for Gaucher disease is the demonstration of low acid β-glucosidase activity in peripheral blood leukocytes (normal range 2.1–5.3 μmol/l/h) [39]. The assay is performed in blood leucocytes using a fluorescent substrate, 4-methyumbelliferone β-glucoside. The test requires 10 cc EDTA blood sample shipped at ambient temperature by overnight delivery to the lab.

### Molecular diagnosis

Molecular analysis of GBA1 gene is complicated by presence of highly homologous pseudogene that harbors several mutations, which if present in the active gene leads to Gaucher disease. A number of techniques have been developed to circumvent potential problems arising from this situation in order to analyze only the active gene sequences uncontaminated by pseudogene sequences [40]. A negative screen for common GBA1 mutations does not exclude Gaucher disease (see discussion). Therefore, undertaking sequencing of the entire coding region of GBA1 gene is recommended in patients strongly suspected of harboring Gaucher disease when a screen for common mutations is negative [40]. Mutation analysis of the GBA1 gene may provide some prognostic information although there is considerable variation of disease severity among patients harboring an identical GBA1 genotype [7] ([Figure 2]). Knowledge of the GBA1 mutation in a proband also facilitates family screening for genetic counseling purposes since heterozygote carriers cannot be reliably identified by enzyme assays.

Consensus Conference: A reappraisal of Gaucher disease - diagnosis and disease management algorithms. Pramod K. Mistry, Maria Domenica Cappellini, Elena Lukina, Hayri Özsan, Sara Mach Pascual, Hanna Rosenbaum, Maria Helena Solano, Zachary Spigelman, Jesús Villarrubia, Nora Watman, and Gero Massenkeil. Am J Hematol. 2011 January ; 86(1): 110–115. doi:10.1002/ajh.21888.

Diagnosis

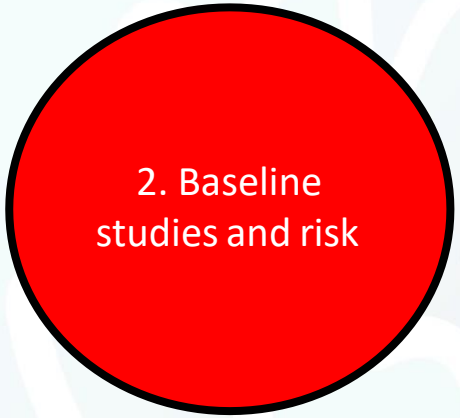
**Tabla 2:** Diagnóstico de la EG:

| DIAGNÓSTICO | VENTAJAS | DESVENTAJAS |
|---|---|---|
| ENZIMÁTICO | ♦ Los leucocitos de sangre periférica o el cultivo de fibroblastos [16] son el material de elección para el estudio enzimático,<br>♦ Desde el año 2002, como fruto de un desarrollo científico argentino, se cuenta con las gotas de sangre en papel de filtro [18] permitiendo la identificación de pacientes y posibilitando el envío de muestras a distancia, el diagnóstico retrospectivo y el eventual tamizaje poblacional. [19] | ♦ No predice la severidad clínica de la enfermedad.[17]<br>♦ Con un resultado anormal en gotas de sangre: recurrir a la confirmación en leucocitos.<br>♦ En heterocigotos puede superponerse con el de la población normal impidiendo el uso del ensayo enzimático para la detección de heterocigotos [20, 21,22] |

# AGENDA

**Therapeutic Opportunities according to therapeutic objectives in Gaucher Disease**

**Therapeutic opportunity =**



# Baseline studies

**Table 2** Initial Assessment

- A complete history of patient and family, preferably including a pedigree
- A comprehensive physical examination (annual)
- Quality of life (annual): Patient-reported functional health and well-being (SF-36 Health Survey)
- Blood tests
  - Primary tests
    - Hemoglobin
    - Platelet count
  - Biochemical markers (one or more of these biochemical markers should be consistently monitored in conjunction with other clinical assessments of disease activity; chitotriosidase, when available as a validated procedure, may be the most sensitive indicator of changing disease activity, and is therefore preferred)
    - Chitotriosidase
    - ACE
    - TRAP
  - Additional blood tests (to be evaluated selectively based on each patient's age and clinical status)
    - WBC, PT, and PTT;
    - Iron, iron binding capacity, ferritin, vitamin $B_{12}$;
    - AST and/or ALT; alkaline phosphatase; calcium, phosphorous, albumin, total protein, total and direct bilirubin;
    - Serum immunoelectrophoresis
    - Hepatitis profile
- β-glucosidase and mutation analysis
- Antibody sample*
- Visceral (contiguous transaxial 10-mm thick sections for sum of region of interest)
  - Spleen volume (volumetric MRI or CT)
  - Liver volume (volumetric MRI or CT)
- Skeletal
  - MRI (coronal; T1- and T2-weighted) of the entire femora
  - X-ray (AP view of the entire femora)† and lateral view of the spine
  - DXA lumbar spine and femoral neck
- Pulmonary (recommended every 12-24 months for patients with borderline or above normal pulmonary pressures at baseline)
  - ECG, chest x-ray, and
  - Doppler echocardiogram (right ventricular systolic pressure) for patients >18 years old

Abbreviations: ACE, angiotensin-converting enzyme; TRAP, tartrate-resistant acid phosphatase; AP, anterior-posterior; ALT, alanine transaminase; AST, aspartate transaminase; CT, computed tomography; DXA, dual-energy x-ray absorptiometry; MRI, magnetic resonance imaging; PT, prothrombin time; PTT, partial thromboplastin time; WBC, white blood cells.

*A baseline sample to be stored at Genzyme Corporation; an optional subsequent sample at 6 months after starting enzyme replacement therapy (ERT). The samples will be tested only if clinically indicated such as for a suspected immune-mediated adverse event, or for suspected loss of ERT effectiveness.

†Optimally from hips to below knees.

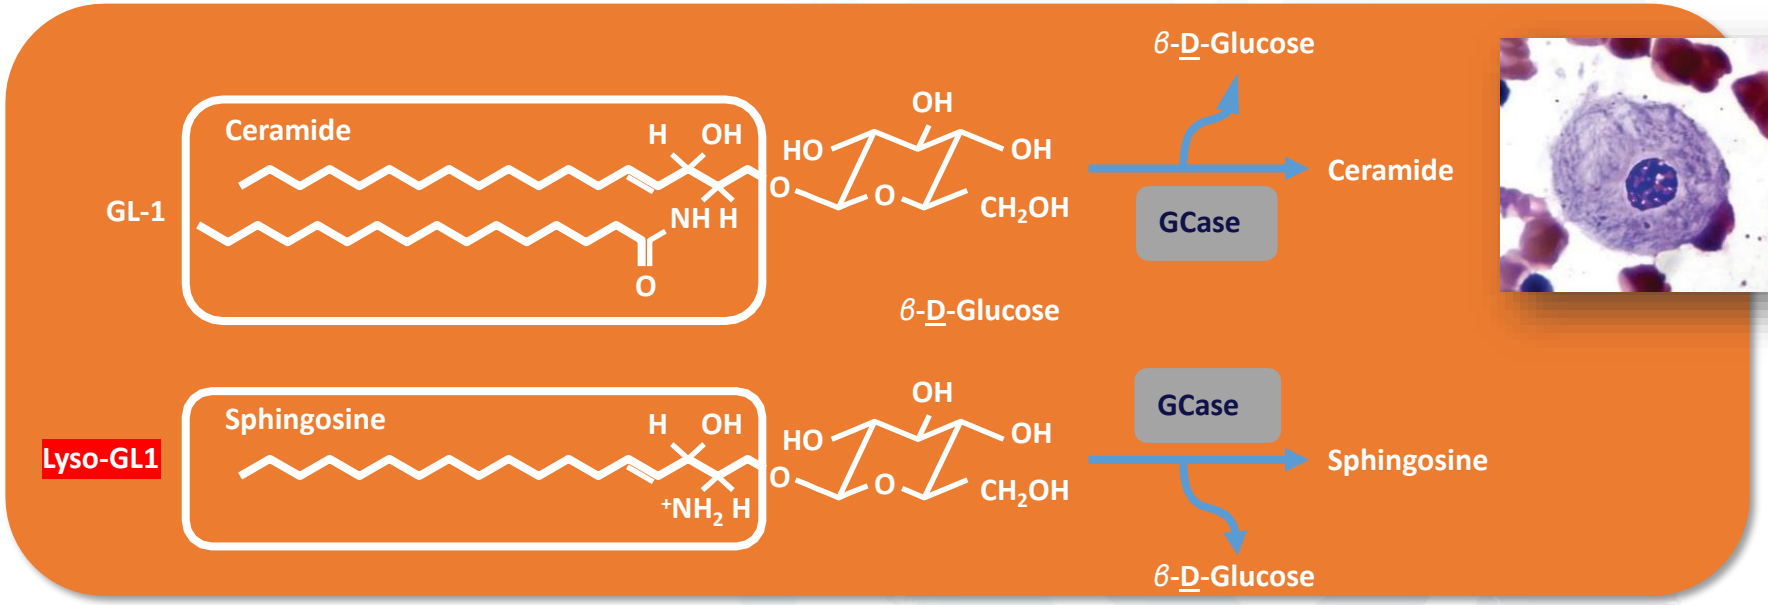
# Glucosylceramide (GL-1) is the Primary Accumulating Lipid in GD



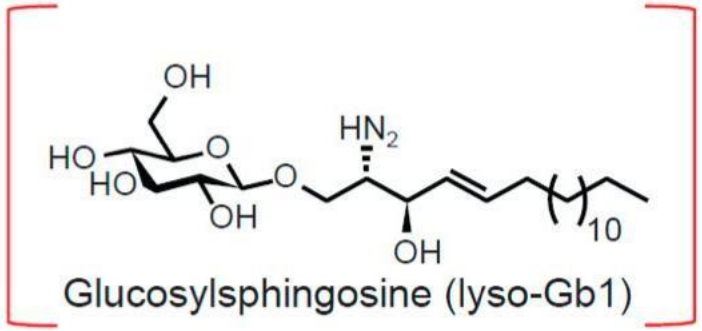
- GL-1 is a component of cell membranes and precursor of complex glycosphingolipids found in receptors and lipid rafts.
- **Lyso-GL1** accumulates via activation of an alternative metabolic pathway, ceramidase—it is a toxic bioactive lipid.

Mielke MM, et al. *PLoS One*. 2013;8:e73094; Dekker N, et al. *Blood*. 2011;118:e118-27;
Grabowski GA, et al. In: Beaudet A, et al (eds). *The Online Metabolic and Molecular Basis of Inherited Metabolic Disease*. 2010.

# Biomarkers in GD

The properties of an ideal biomarker in GD should meet the following criteria:

- Easily measurable and stable in easily accessible sample.
- Be specific and sensitive for GD.
- Accurately reflect the presence and activity of GD
- Predict significant clinical changes
- Have a direct role in the pathophysiology of GD
- Absence of genetic variation
- Change in a tangible and measurable way with treatment
- Be applicable to all patients
- Have an affordable cost to make it feasible



Glucosylsphingosine (lyso-Gb1)

Lyso-GL1 correlation

Correlation with established biomarkers
Fall dramatically with imiglucerase ERT
Monitoring patients on or off therapy
Extent of disease burden and residual disease
Correlate with liver volume and spleen volume, platelet counts and age
Role in immune dysregulation
Skeletal disease
Chronic metabolic inflammation

Children

When?

**Table 1**
Children (< 18 years) with Gaucher disease: Risk assessment

| Increased Risk | All Others |
|---|---|
| One or more of the following in addition to physical signs: | All children with any relevant physical signs or manifestations of Gaucher disease should be treated with ERT |
| Symptomatic disease, including manifestations of abdominal or bone pain, fatigue, exertional limitations, weakness, and cachexia | |
| Growth failure | |
| Any evidence of skeletal involvement, including Erlenmeyer flask deformity (EFD) | |
| Platelet count ≤ 60,000 $mm^3$ and/or documented abnormal bleeding episode(s) | |
| Hemoglobin ≤ 2.0 g/dL below lower limit of normal for age and sex | |
| Impaired quality of life (QOL) due to Gaucher disease | |

- Generally, the recommended initial imiglucerase dose children at increased risk is 60 units/kg body weight every 2 weeks.
- Insufficient information is available concerning dose reduction in the pediatric population.

# Starting doses?

Adults

When?

**Table 2**
Adults with Gaucher disease: Risk assessment

| Increased risk | Lower risk |
|---|---|
| One or more of the following: | Level of disease meets ALL of the following: |
| Symptomatic skeletal disease | Normal liver, cardiac, lung and renal functions<br>Minimal impairment of QOL<br>No obvious or recent rapid progression of disease manifestations<br>Skeletal disease limited to mild osteopenia and Erlenmeyer flask deformity<br>Hemoglobin > 10.5 g/dL for females and > 11.5 g/dL for males (or not more than 2.0 g/dL below lower limit of normal for age and sex)<br>Platelet count > 60,000 $mm^3$ on three determinations<br>Liver volume < 2.5 × normal<br>Spleen volume < 15 × normal |
| Moderate to severe osteopenia | |
| Chronic bone pain | |
| Bone crises | |
| Avascular necrosis | |
| Pathological fractures | |
| Joint replacement(s) | |
| Impaired QOL due to Gaucher disease | |
| Cardiopulmonary disease, including pulmonary hypertension | |
| Platelet count ≤ 60,000 $mm^3$ or documented abnormal bleeding episodes | |
| Symptomatic anemia or hemoglobin ≤ 8.0 g/dL | |
| Transfusion dependency | |
| Significant liver disease | |
| Hepatomegaly that is 2.5 × normal | |
| Infarcts | |
| Portal hypertension | |
| Hepatitis | |
| Significant splenic disease | |
| Splenomegaly that is ≥ 15 × normal | |
| Infarcts | |
| Significant renal disease | |
| Any concomitant medical condition that further complicates or exacerbates Gaucher disease or its signs and symptoms | |

Generally, the recommended initial imiglucerase dose in adults:

- Increased risk is 60 units/kg body weight every 2 weeks.
- Lower risk adults is 30 to 45 units/kg every 2 weeks.

# Dose – response relationship for ERT with Cerezyme in patients with GD Type 1

When?

Retrospectively comparison of long-term outcome of ERT at 2 large European treatment centers,

- AMC, The Netherlands (n=49, median dose, 15-30 U/kg/4 wks)
- HHU, Germany (n= 57, median dose, 80 U/kg/4 wks).

All follow-up parameters were matched separately at baseline.

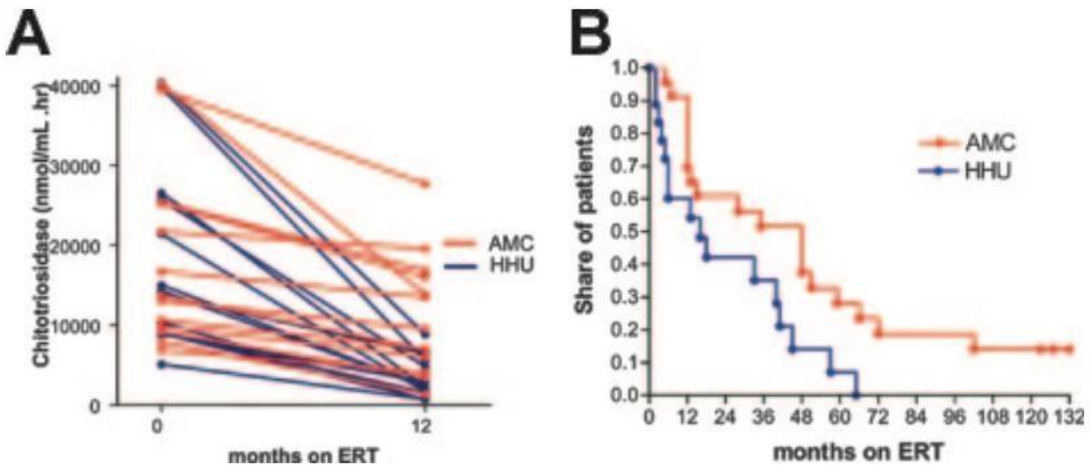

**Figure 3. Impact of ERT on changes on plasma chitotriosidase activity.** (A) Plasma chitotriosidase at baseline and after 12 months, (B) time to reach a chitotriosidase of less than 5000 nmol/mL/h. Chitotriosidase levels of carriers of the chitotriosidase null mutation were multiplied by 2.[29]

1. Dose-response relationships for enzyme replacement therapy with imiglucerase/alglucerase in patients with Gaucher disease type 1. Gregory A. Grabowski, Katherine Kacena, P. Alexander Cole, Carla Hollak, Lin Zhang, John Yee, Pramod K. istry, Ari Zimran, Joel Charrow and Stephan vom Dahl. Genet Med. 2009 February ; 11(2): 92–100.
2. Superior effects of high-dose enzyme replacement therapy in type 1 Gaucher disease on bone marrow involvement and chitotriosidase levels: a 2-center retrospective analysis. Carla E. M. Hollak, Mario Maas, Ludger W. Poll, and Stephan vom Dahl. Blood, 1 August 2006. Volume 108, number 3.

When?

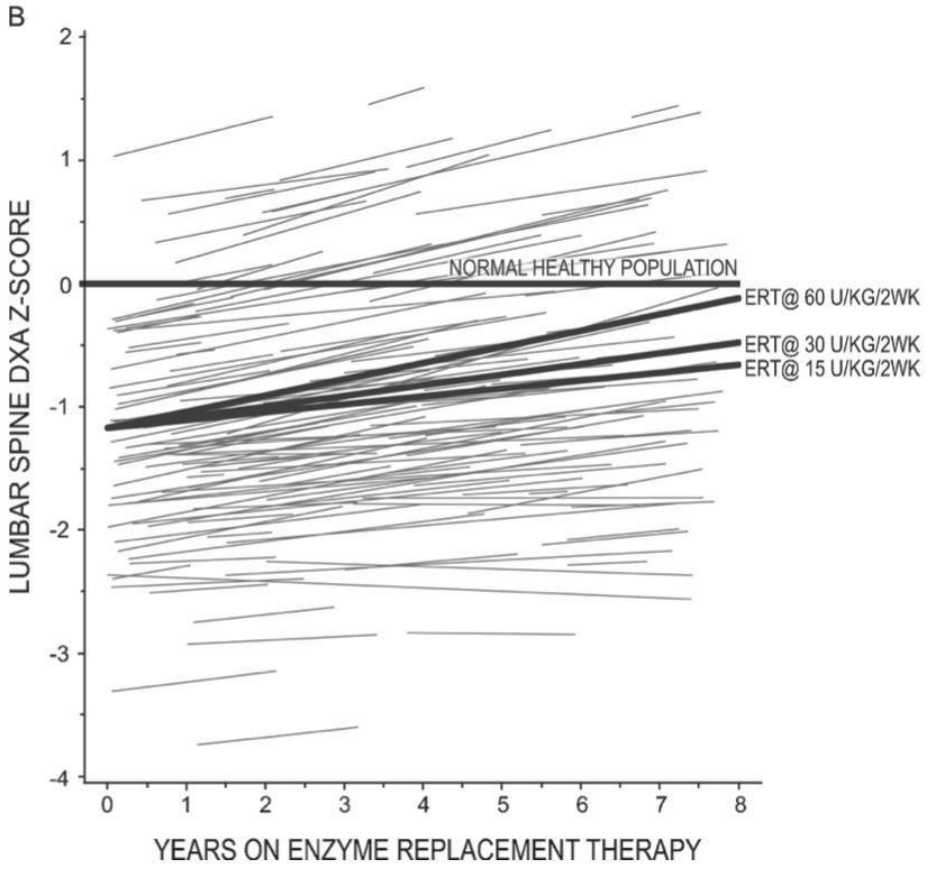
## Dose – response relationship for ERT with Cerezyme in patients with GD Type 1

ERT with imiglucerase may significantly reverse decreases in lumbar spine BMD in a dose-dependent manner. However, the time required to achieve a normal BMD is usually longer than the time required to attain therapeutic goals for the hematological and visceral aspects of GD.



3. Effect of Enzyme Replacement Therapy With Imiglucerase on BMD in Type 1 Gaucher Disease. Richard J Wenstrup, Katherine A Kacena, Paige Kaplan, Gregory M Pastores, Ainu Prakash-Cheng, Ari Zimran, and Thomas N Hangartne. J Bone Miner Res 2007;21:119–126. Published online on October 9, 2006.

**Table 4**
Essential recommended assessments for Gaucher disease type 1 patients with asterisks indicating assessments specific to eliglustat.

| | Baseline | Year 1 | Long Term |
|---|---|---|---|
| History | | | |
| Cardiac, renal, and hepatic status | Yes | At each visit or with significant changes in disease status | At each visit or with significant changes in disease status |
| Pregnancy, intent to become pregnant, and lactation* | Yes | At each visit | At each visit |
| Medications | | | |
| Concomitant medications* (including grapefruit) with regard to CYP2D6, CYP3A, and P-gp substrate metabolism | Yes | At each visit or with significant changes in disease status | At each visit or with significant changes in disease status |
| Medication adherence* | Yes (assess ability to adhere) | At each visit or with significant changes in disease status | At each visit or with significant changes in disease status |
| Blood | | | |
| Complete blood count (i.e., monitoring of hemoglobin and platelets) | Yes | Every 3 months | Every 6–12 months (or as clinically indicated) to assess against therapeutic goals |
| Biomarkers (CCL18 if available, chitotriosidase, TRAP, ACE) | Yes | Every 3 months | Every 6–12 months or as clinically indicated |
| CYP2D6 metabolizer profile* | Yes | Not applicable | Not applicable |
| Hepatic function (should include AST, ALT, AP, bilirubin, albumin) | Yes | Annually | Annually |
| PT/PTT | Yes | Annually | Annually |
| Renal function – should include BUN, creatinine, eGFR | Yes | Annually | Annually |
| Electrolytes | Yes | Annually | Annually |
| Imaging | | | |
| Spleen and liver volumes (MRI preferred) | Yes | Annually | Annually |
| MRI (coronal; T1- and T2-weighted) of the entire femora | Yes | Annually | Annually |
| X-ray: AP of femora and lateral of spine | Yes | As clinically indicated | As clinically indicated |
| DEXA (hip and spine) | Yes | NA | Every 2 years or as clinically indicated |
| ECG | Yes | As clinically indicated | As clinically indicated |

ACE: angiotensin converting enzyme; ALT: alanine aminotransferase; AST: aspartate aminotransferase; AP: alkaline phosphatase; BUN: blood urea nitrogen; CCL 18: chemokine (C-C motif) ligand 18; DEXA: dual-energy X-ray absorptiometry; ECG: electrocardiogram; GFR: glomerular filtration rate; MRI: magnetic resonance imaging; PT: prothrombin time; PTT: partial thromboplastin time; TRAP: tartrate resistant acid phosphatase.

* These assessments are considered essential for monitoring patients with Gaucher disease type 1 on eliglustat therapy. Additional tests that may be useful in the care of patients with Gaucher disease type 1 are discussed in the text. Recommendations for comprehensive evaluation and monitoring of patients with Gaucher disease type 1 have been published elsewhere

# Therapeutic Goals in the Treatment of Gaucher Disease

Gregory M. Pastores,[a] Neal J. Weinreb,[b] Hans Aerts,[c] Generoso Andria,[d] Timothy M. Cox,[e] Manuel Giralt,[f] Gregory A. Grabowski,[g] Pramod K. Mistry,[h] and Anna Tylki-Szymańska[i]

TGs

## Therapeutic Objectives?

**Table 1 Therapeutic Goals for Anemia**

- Increase hemoglobin levels within 12 to 24 months to
  - ≥11.0 g/dL for women and children
  - ≥12.0 g/dL for men
- Eliminate blood transfusion dependency
- Reduce fatigue, dyspnea, angina
- Maintain improved Hb values achieved after the first 12 to 24 months of therapy

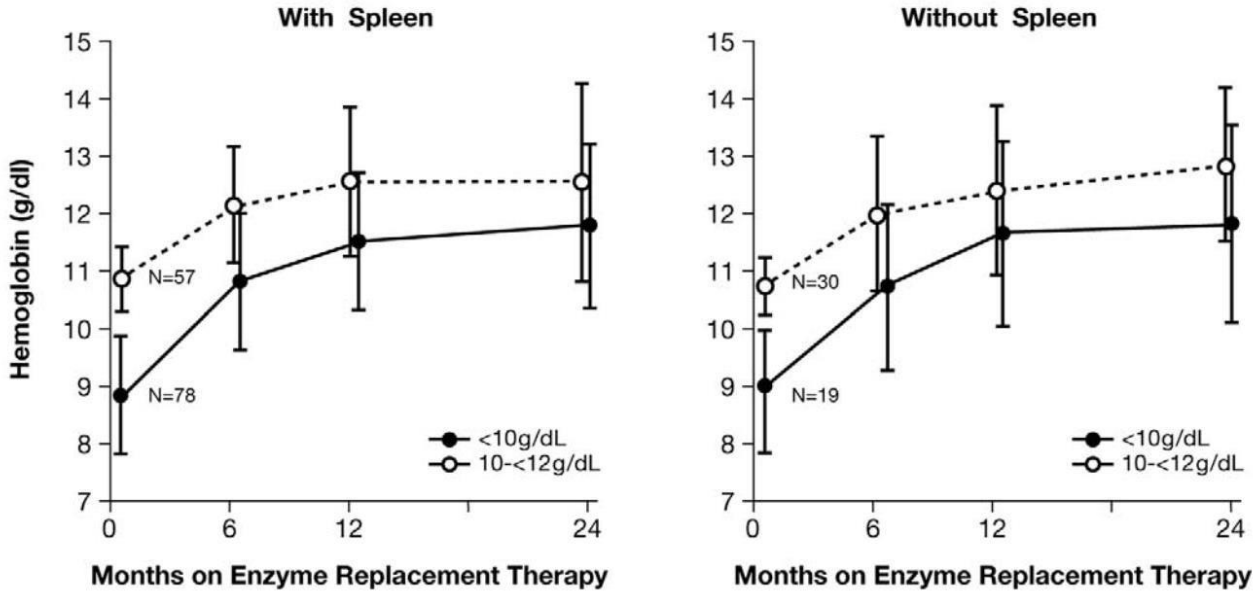

**Figure 1** Changes in hemoglobin concentration during the first 2 years of ERT among patients in the ICGG Gaucher Registry. Reprinted with permission from Excerpta Medica.[9]

sanofi

## Therapeutic Objectives?

**Table 2** Therapeutic Goals for Thrombocytopenia

- All patients: increase platelet counts during the first year of treatment sufficiently to prevent surgical, obstetrical, and spontaneous bleeding.
- Patients with splenectomy: normalization of platelet count by 1 year of treatment
- Patients with an intact spleen:
  - Moderate baseline thrombocytopenia: the platelet count should increase by 1.5- to 2.0-fold by year 1 and approach low-normal level by year 2
  - Severe baseline thrombocytopenia: the platelet count should increase by 1.5-fold by year 1 and continue to increase slightly during years 2 to 5 (doubling by year 2), but normalization is not expected
  - Avoid splenectomy (may be necessary during life-threatening hemorrhagic events)
  - Maintain stable platelet counts to eliminate risks of bleeding after a maximal response has been achieved

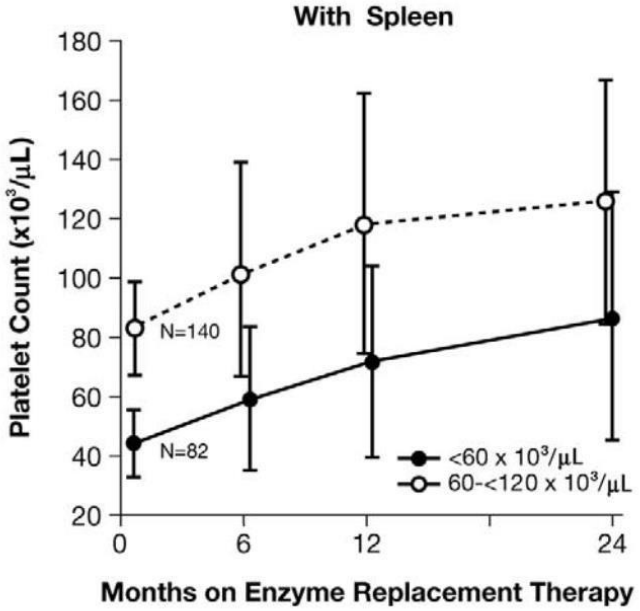

**Figure 2** Changes in platelet counts during the first 2 years Reprinted with permission from Excerpta Medica.[9]

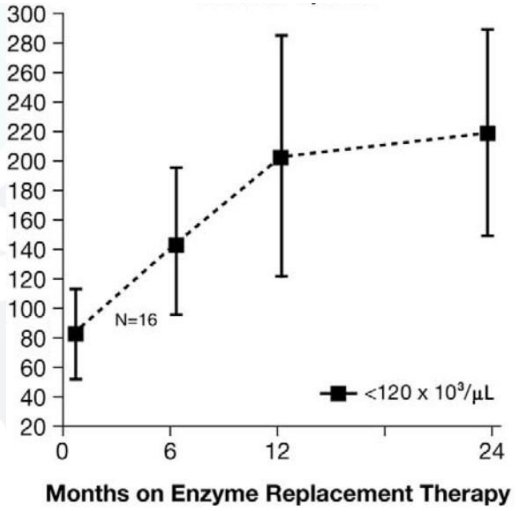

ERT among patients in the ICGG Gaucher Registry.

TGs

**Table 3** Therapeutic Goals for Hepatomegaly

- Reduce and maintain the liver volume to 1.0 to 1.5 times normal
- Reduce the liver volume by 20% to 30% within year 1 to 2 and by 30% to 40% by year 3 to 5

**Table 4** Therapeutic Goals for Splenomegaly

- Reduce and maintain spleen volume to ≤2 to 8 times normal
- Reduce the spleen volume by 30% to 50% within year 1 and by 50% to 60% by year 2 to 5
- Alleviate symptoms due to splenomegaly: abdominal distension, early satiety, new splenic infarction
- Eliminate hypersplenism

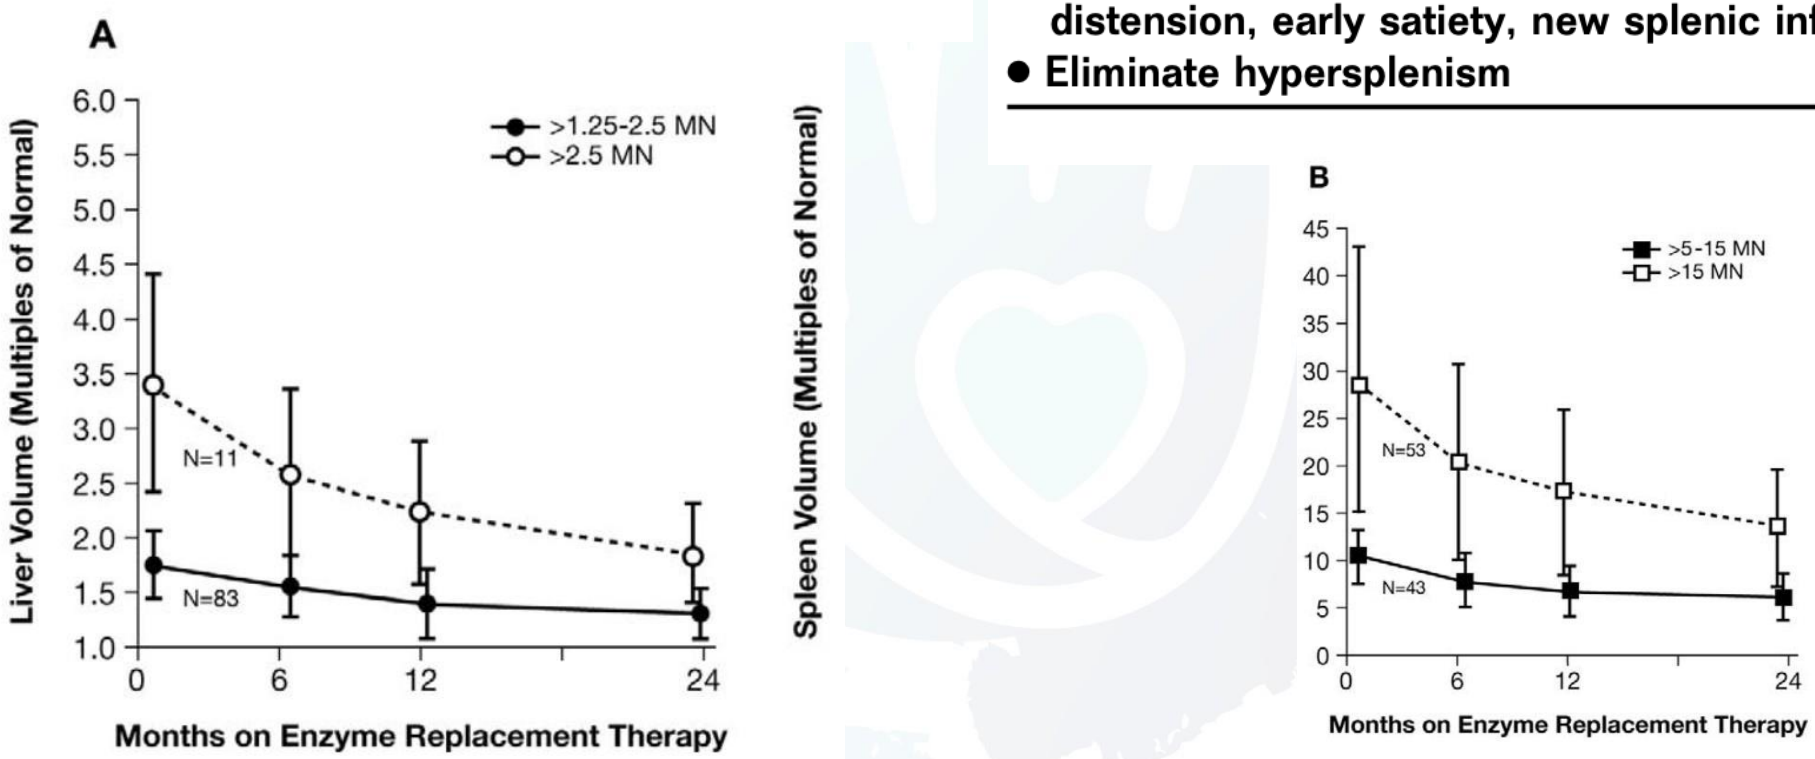

**Figure 3** Changes in liver volume (A, patients with spleen) and spleen volume (B) according to baseline size during the first 2 years of ERT for patients in the ICGG Gaucher Registry. Reprinted with permission from Excerpta Medica.[9]

sanofi

TGs

## Table 5 Therapeutic Goals for Skeletal Pathology

- Lessen or eliminate bone pain within 1 to 2 years
- Prevent bone crises
- Prevent osteonecrosis and subchondral joint collapse
- Improve BMD
  - Pediatric patients
    - Attain normal or ideal peak skeletal mass
    - Increase cortical and trabecular BMD by year 2
  - Adult patients
    - Increase trabecular BMD by 3 to 5 years

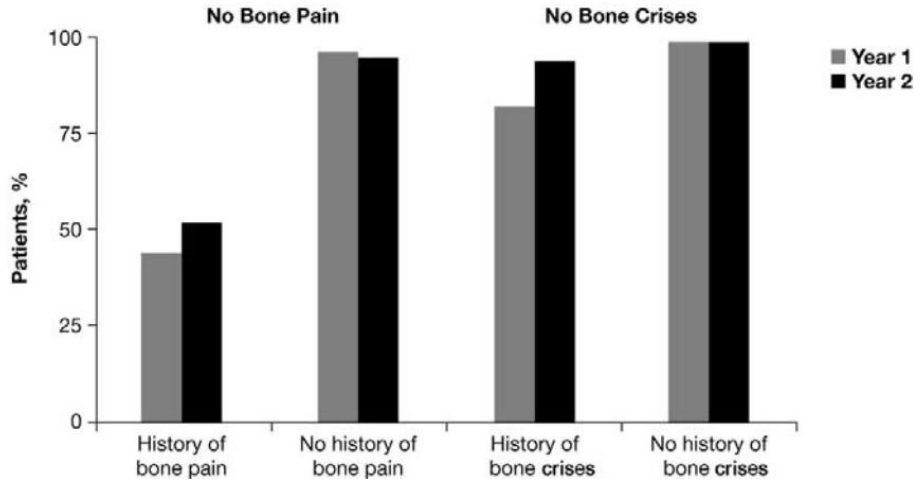

**Figure 4** Bone pain and bone crises among patients in the ICGG Gaucher Registry receiving ERT for 2 years according to previous history of bone pain and bone crises. Reprinted with permission from Excerpta Medica.[9]

## Table 6 Therapeutic Goals for Growth in Pediatric Patients

- Normalize growth such that patient achieves a normal height according to population standards within 3 years of treatment.
- Achieve normal onset of puberty

## Table 7 Therapeutic Goals for Pulmonary Involvement

- Reverse hepatopulmonary syndrome and dependency on oxygen
- Ameliorate pulmonary hypertension (ERT plus adjuvant therapies)
- Improve functional status and quality of life
- Prevent rapid deterioration of pulmonary disease and sudden death
- Prevent pulmonary disease by timely initiation of ERT and avoidance of splenectomy

sanofi

# TGs for patients with GD

## Short Term TGS

- **Reduce bone pain** (not related to irreversible bone disease) within 1–2 years
- **Decrease BM involvement** in patients without severe, irreversible disease
- **Increase BMD by 2 years in adult patients** with a T-score **below -2.5** at baseline
- Attain **normal** or **ideal peak skeletal mass** in **children**
- **Normalize growth** in line with target height within 2 years of treatment

## Lonf Term TGS

- **Prevent bone complications** (e.g. AVN, bone infarcts, bone crises)
- **Prevent osteopenia and osteoporosis** (maintain BMD T-scores above -1)
- **Prevent chronic use of analgesic medication for bone pain**
- **Maintain normal mobility** (or improve mobility if impaired at baseline)
- **Increase physical activity**

# Cerdelga: First-Line Oral Therapy for Adult Patients With Gaucher Disease Type 1

Options

- Proven safety and efficacy supported by one 8-year long-term Phase 2 study, two pivotal Phase 3 studies (ENGAGE and ENCORE), and one supplemental dose frequency Phase 3b study (EDGE)[1-5]
- Nearly 400 patients including treatment-naïve and patients previously stabilized on ERT
  - 29 Countries
  - 1400 person-years of Cerdelga exposure
- Regulatory approval in US (2014) and EU (2015)
  - In the US, 32% of all GD1 adult patients are treated with Cerdelga (~600 patients)
  - Cerdelga is currently approved in 28 countries.
  - Worldwide, approximately 1500 patients are being treated with Cerdelga

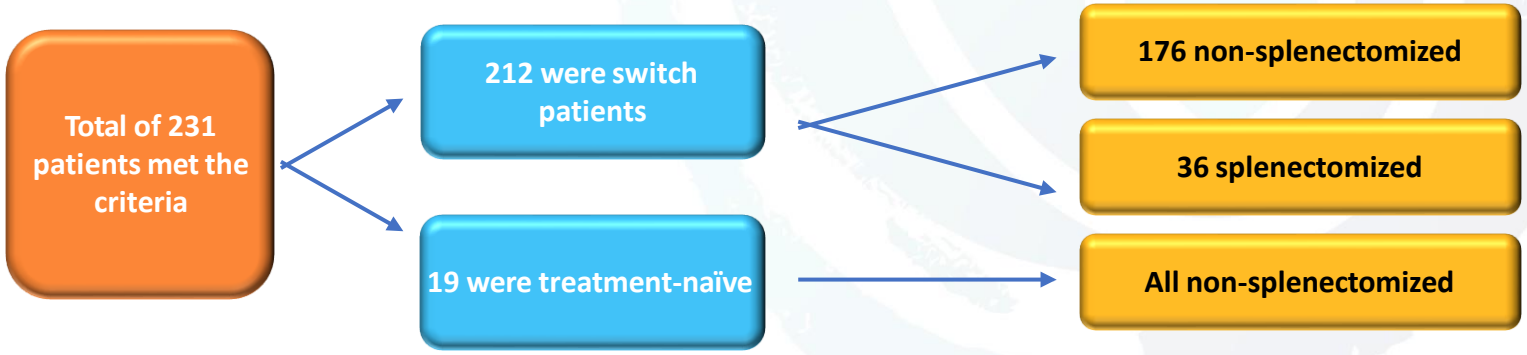
# 231 Cerdelga-treated Patients From the ICGG Gaucher Registry

Options

- Among 6341 patients enrolled in the ICGG Gaucher Registry as of January 2019, 466 had been treated with eliglustat.
- Among these eliglustat-treated patients, **231** met the following criteria and had:
  - Eliglustat treatment dates
  - Confirmed Gaucher disease Type 1 with a diagnosis date
  - Known splenectomy status (including date of splenectomy if splenectomized)
  - Been treated with eliglustat for at least **1 year**
  - Baseline and 2-year data (plus or minus 1 year) while on eliglustat and no other GD therapy for at least one key parameter: hemoglobin, platelet count, liver volume, spleen volume, bone pain or bone crisis



- 87% of patients had genotypes associated with less severe disease (at least one N370S allele).
- 96% of patients were eligible for eliglustat based on CYP2D6 metabolizer status.
- 89% of patients were from the United States, the first country to approve eliglustat

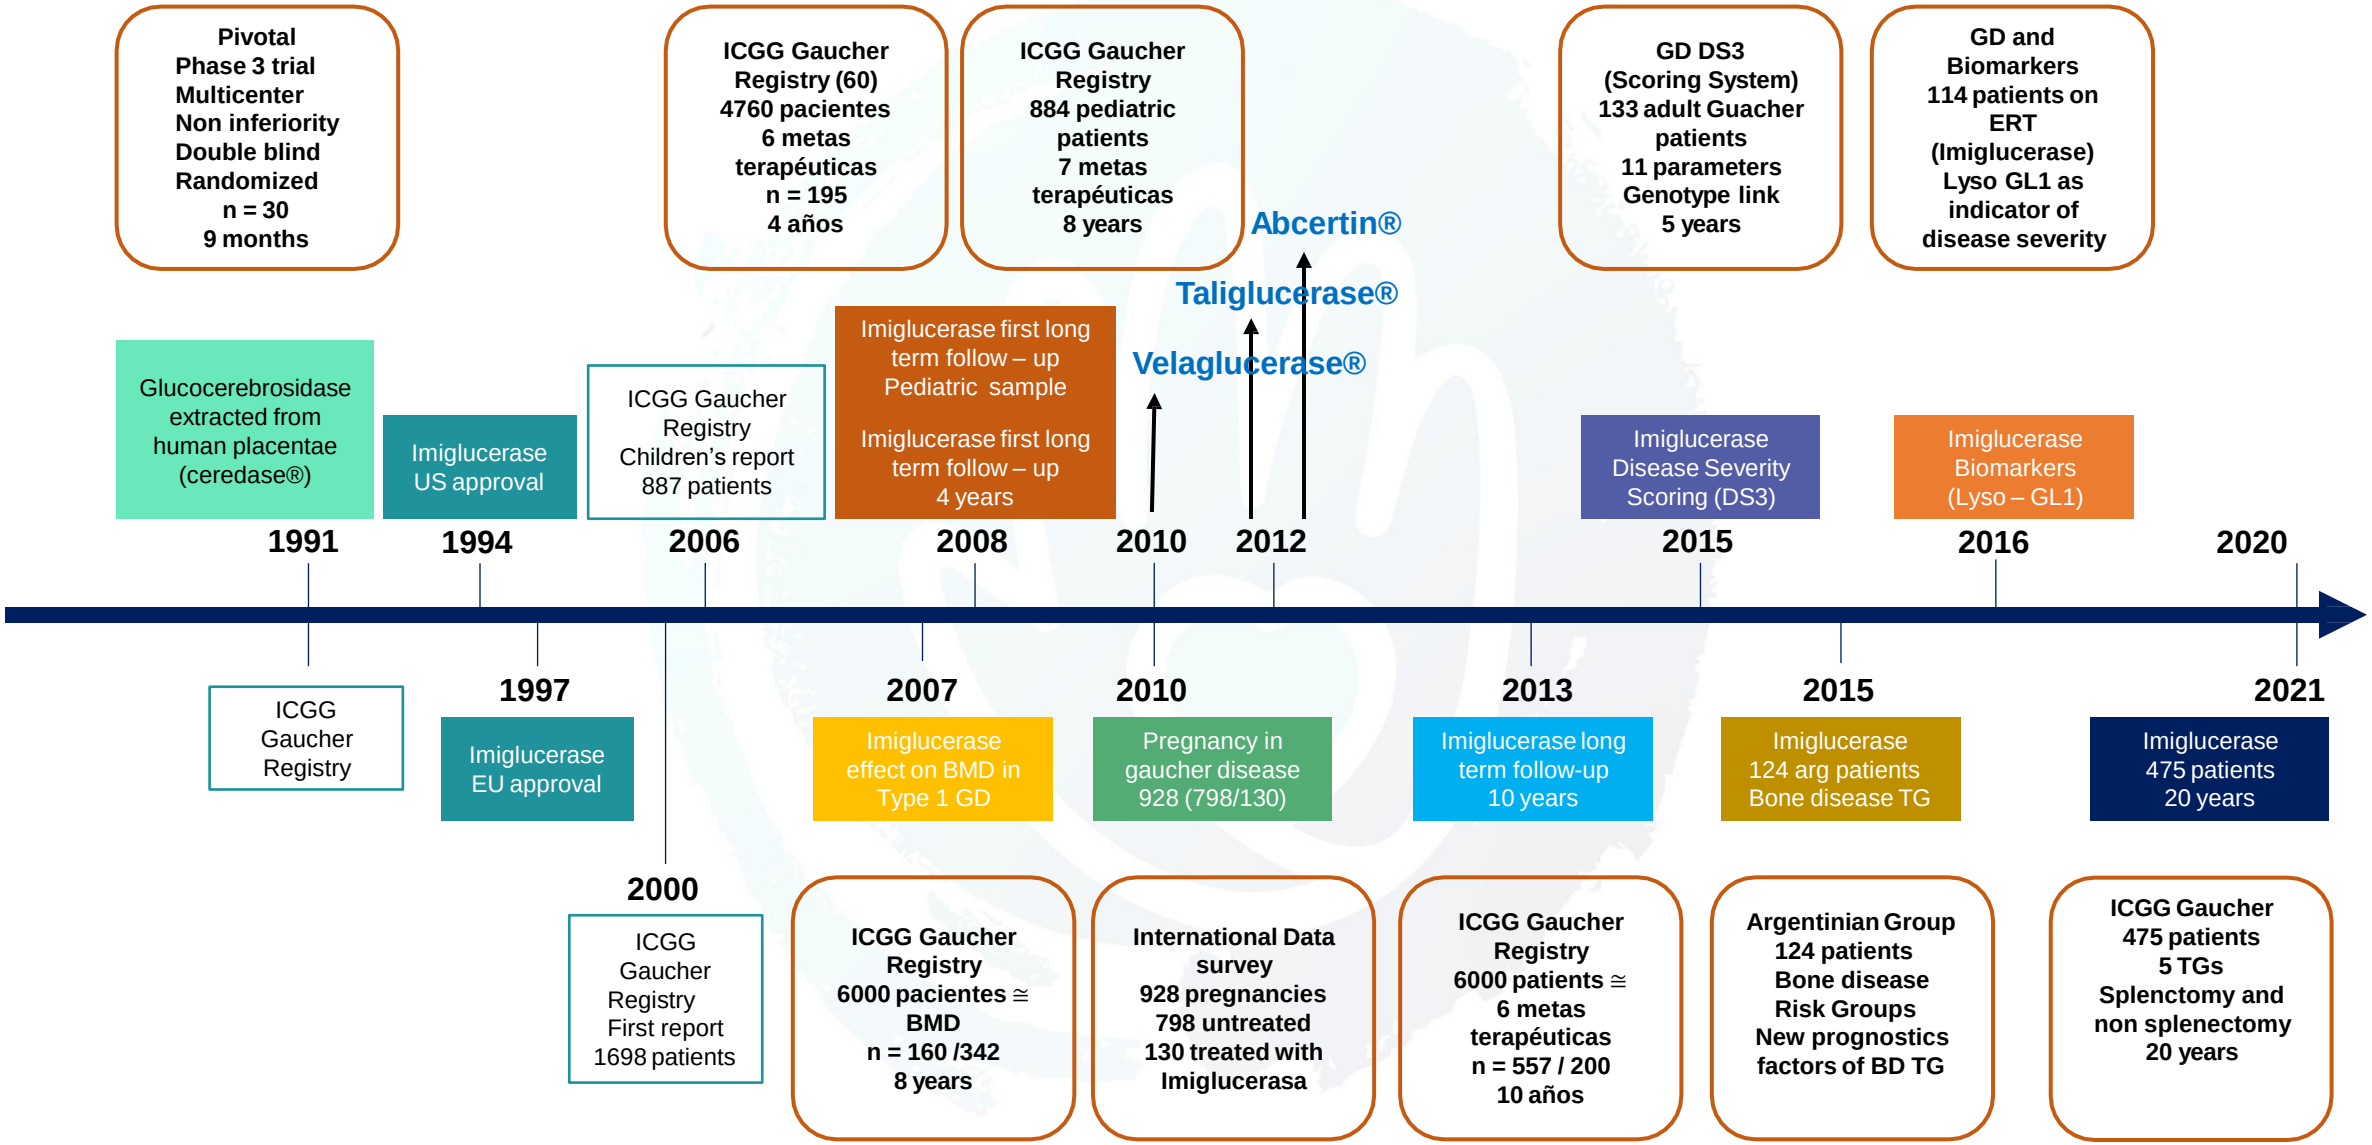
# Summary of Real-World Evidence from the ICGG Gaucher Registry

- Analysis of the ICGG Gaucher Registry provides real-world evidence of Cerdelga efficacy that is consistent with reports from the Phase 2 and Phase 3 clinical trials
- This analysis demonstrated long-term benefit of Cerdelga in treatment-naïve patients and ERT switch in patients, in keeping with established therapeutic goals for Gaucher disease type 1

Mistry et al. *Am J Hematol.* 2020 May 21. doi: 10.1002/ajh.25875. Online ahead of print.

# Safety and Efficacy in Gaucher Disease



22. Vagishwari Murugesan, Pramod K. Mistry et al. Glucosylsphingosine is a key biomarker of Gaucher disease. American Journal of Hematology, Vol. 91, No. 11, November 2016
